Intelligent automation

Looking beyond today

Intelligent Automation (IA) enabled by Artificial Intelligence (AI)

Our payroll team has begun integrating AI and emerging technologies to reduce compliance complexity and release capacity for payroll teams.

We recently launched a new Payroll Assistant which helps trained payroll professionals do their jobs efficiently by providing correct, intelligent access to the full body of payroll regulations.

We're also building out our AI Agent Ecosystem to support **Data Driven** decision making.

Our agents will use AI and machine learning to **detect anomalies, plan actions** and tasks and **carry out analysis** required by payroll managers.

Our agents will work 24 * 7 and in real time in response to events as they occur during day-to-day operations.

Ai Agent Toolkit

Building trust in AI for payroll

Payroll systems are like a one-way mirror. You can only see what comes out only those on the inside can see what's happening. You shouldn't need to run a report to see how your payroll is set up — you should be able to ask it.

Assessing and selecting an **AI** tool

- Who is going to use it?

- What level of training do they need to review work done by intelligent automations?

- How does the verification and delegation process need to adapt to that?

- How will you keep humans in the loop?

- How will you measure the benefit?

Want clarity on which tools suit your organisation best? These questions will make sure you get what you need.
